Amazon Fine Food Reviews Analysis Using RF and GBDT

Data Source: https://www.kaggle.com/snap/amazon-fine-food-reviews (https://www.kaggle.com/snap/amazon

EDA: https://nycdatascience.com/blog/student-works/amazon-fine-foods-visualization/)

The Amazon Fine Food Reviews dataset consists of reviews of fine foods from Amazon.

Number of reviews: 568,454 Number of users: 256,059 Number of products: 74,258 Timespan: Oct 1999 - Oct 2012

Number of Attributes/Columns in data: 10

Attribute Information:

- 1. Id
- 2. ProductId unique identifier for the product
- 3. UserId ungiue identifier for the user
- 4. ProfileName
- 5. HelpfulnessNumerator number of users who found the review helpful
- 6. HelpfulnessDenominator number of users who indicated whether they found the review helpful or not
- 7. Score rating between 1 and 5
- 8. Time timestamp for the review
- 9. Summary brief summary of the review
- 10. Text text of the review

Objective:

Given a review, determine whether the review is positive (Rating of 4 or 5) or negative (rating of 1 or 2).

[Q] How to determine if a review is positive or negative?

[Ans] We could use the Score/Rating. A rating of 4 or 5 could be cosnidered a positive review. A review of 1 or 2 could be considered negative. A review of 3 is nuetral and ignored. This is an approximate and proxy way of determining the polarity (positivity/negativity) of a review.

Loading the data

The dataset is available in two forms

- 1. .csv file
- 2. SQLite Database

In order to load the data, We have used the SQLITE dataset as it easier to query the data and visualise the data efficiently.

Here as we only want to get the global sentiment of the recommendations (positive or negative), we will purposefully ignore all Scores equal to 3. If the score id above 3, then the recommendation will be set to "positive". Otherwise, it will be set to "negative".

```

[1]. Reading Data

```
In [2]: # using SQLite Table to read data.
        con = sqlite3.connect('D:\\TGM\\ML\\AmazonFineFoodReviews\\database.sqlite')
        # filtering only positive and negative reviews i.e.
        # not taking into consideration those reviews with Score=3
        # SELECT * FROM Reviews WHERE Score != 3 LIMIT 500000, will give top 500000 da
        ta points
        # you can change the number to any other number based on your computing power
        # filtered_data = pd.read_sql_query(""" SELECT * FROM Reviews WHERE Score != 3
        LIMIT 500000""", con)
        # for tsne assignment you can take 5k data points
        filtered data = pd.read sql query(""" SELECT * FROM Reviews WHERE Score != 3 L
        IMIT 100000""", con)
        # Give reviews with Score>3 a positive rating(1), and reviews with a score<3 a
        negative rating(0).
        def partition(x):
            if x < 3:
                 return 0
            return 1
        #changing reviews with score less than 3 to be positive and vice-versa
        actualScore = filtered data['Score']
        positiveNegative = actualScore.map(partition)
        filtered data['Score'] = positiveNegative
        print("Number of data points in our data", filtered data.shape)
        filtered data.head(3)
```

Exploratory Data Analysis

[2] Data Cleaning: Deduplication

It is observed (as shown in the table below) that the reviews data had many duplicate entries. Hence it was necessary to remove duplicates in order to get unbiased results for the analysis of the data. Following is an example:

In [7]: display= pd.read_sql_query("""
 SELECT *
 FROM Reviews
 WHERE Score != 3 AND UserId="AR5J8UI46CURR"
 ORDER BY ProductID
 """, con)
 display.head()

Out[7]:

	ld	ProductId	Userld	ProfileName	HelpfulnessNumerator	Helpful
0	78445	B000HDL1RQ	AR5J8UI46CURR	Geetha Krishnan	2	2
1	138317	B000HDOPYC	AR5J8UI46CURR	Geetha Krishnan	2	2
2	138277	B000HDOPYM	AR5J8UI46CURR	Geetha Krishnan	2	2
3	73791	B000HDOPZG	AR5J8UI46CURR	Geetha Krishnan	2	2
4	155049	B000PAQ75C	AR5J8UI46CURR	Geetha Krishnan	2	2

As can be seen above the same user has multiple reviews of the with the same values for HelpfulnessNumerator, HelpfulnessDenominator, Score, Time, Summary and Text and on doing analysis it was found that

ProductId=B000HDOPZG was Loacker Quadratini Vanilla Wafer Cookies, 8.82-Ounce Packages (Pack of 8)

ProductId=B000HDL1RQ was Loacker Quadratini Lemon Wafer Cookies, 8.82-Ounce Packages (Pack of 8) and so on

It was inferred after analysis that reviews with same parameters other than ProductId belonged to the same product just having different flavour or quantity. Hence in order to reduce redundancy it was decided to eliminate the rows having same parameters.

The method used for the same was that we first sort the data according to ProductId and then just keep the first similar product review and delete the others. for eg. in the above just the review for ProductId=B000HDL1RQ remains. This method ensures that there is only one representative for each product and deduplication without sorting would lead to possibility of different representatives still existing for the same product.

Observation:- It was also seen that in two rows given below the value of HelpfulnessNumerator is greater than HelpfulnessDenominator which is not practically possible hence these two rows too are removed from calcualtions

```
In [11]: display= pd.read_sql_query("""
    SELECT *
    FROM Reviews
    WHERE Score != 3 AND Id=44737 OR Id=64422
    ORDER BY ProductID
    """, con)
    display.head()
```

Out[11]:

	ld	ProductId	Userld	ProfileName	HelpfulnessNumerator	Helpfulr
0	64422	B000MIDROQ	A161DK06JJMCYF	J. E. Stephens "Jeanne"	3	1
1	44737	B001EQ55RW	A2V0I904FH7ABY	Ram	3	2

- In [12]: final=final[final.HelpfulnessNumerator<=final.HelpfulnessDenominator]</pre>
- In [13]: #Before starting the next phase of preprocessing lets see the number of entrie
 s left
 print(final.shape)

 #How many positive and negative reviews are present in our dataset?
 print(final['Score'].value_counts())

(87773, 10) 1 73592 0 14181

Name: Score, dtype: int64

[3]. Text Preprocessing.

Now that we have finished deduplication our data requires some preprocessing before we go on further with analysis and making the prediction model.

Hence in the Preprocessing phase we do the following in the order below:-

- 1. Begin by removing the html tags
- 2. Remove any punctuations or limited set of special characters like, or . or # etc.
- 3. Check if the word is made up of english letters and is not alpha-numeric
- 4. Check to see if the length of the word is greater than 2 (as it was researched that there is no adjective in 2-letters)
- 5. Convert the word to lowercase
- 6. Remove Stopwords
- 7. Finally Snowball Stemming the word (it was observed to be better than Porter Stemming)

After which we collect the words used to describe positive and negative reviews

```
In [14]: # printing some random reviews
    sent_0 = final['Text'].values[0]
    print(sent_0)
    print("="*50)

    sent_1000 = final['Text'].values[1000]
    print(sent_1000)
    print("="*50)

    sent_1500 = final['Text'].values[1500]
    print(sent_1500)
    print("="*50)

    sent_4900 = final['Text'].values[4900]
    print(sent_4900)
    print("="*50)
```

My dogs loves this chicken but its a product from China, so we wont be buying it anymore. Its very hard to find any chicken products made in the USA but t hey are out there, but this one isnt. Its too bad too because its a good pro duct but I wont take any chances till they know what is going on with the chi na imports.

The Candy Blocks were a nice visual for the Lego Birthday party but the candy has little taste to it. Very little of the 2 lbs that I bought were eaten an d I threw the rest away. I would not buy the candy again.

was way to hot for my blood, took a bite and did a jig lol

My dog LOVES these treats. They tend to have a very strong fish oil smell. So if you are afraid of the fishy smell, don't get it. But I think my dog likes it because of the smell. These treats are really small in size. They are great for training. You can give your dog several of these without worrying about him over eating. Amazon's price was much more reasonable than any other retailer. You can buy a 1 pound bag on Amazon for almost the same price as a 6 ounce bag at other retailers. It's definitely worth it to buy a big bag if your dog eats them a lot.

GBDT

Conclusion

| TF-IDFWeighted W2V |

0.121

-----+

0.098

- 1. Applied Random Forest and GBDT using XGBosst on all the 4 vectorizers(BOW, TFIDF, AVG-W2V, TFIDF-AVG W2V).
- 2. Sorted the data based on Time and Considered 100 K data points for Training set 70K, Test set: 30K.
- 3. Plotted Seaborn Heatmap for the performance of the modal on both train and cross validation data for hyper parameter n_estimators as X-axis and max_depth as Y-axis.
- 4. Used accuracy and n_estimators, max_depth as a metric for hyperparameter tuning. And took the best depth in the range of [1,5,10] and the best n_estimators in range [5, 10, 20, 40, 60, 80, 100, 120, 150] for GBDT took the best depth in the range of [1,5].
- 5. Found the top 20 features for featurizations BOW & TFIDF & TFIDFW2V and printed the important features using WordCloud.
- 6. Plotted the ROC curve and Confusion Matix for Train and Test Data for each featurizations.
- 7. With reference to the pretty table, here is my understanding: Accuracy imporved while using XGBoost alogorithm.
